

How do I install the ASP.net seal?

rdavis@foregenix.com - 2019-05-02 - Comments (0) - ASP

Intro

When you first sign up for FGX-Web you will be directed to the Secure Seal Configuration Wizard. This wizard will guide you through the steps you need to install the Secure Seal on your website.

The screenshot shows the Foregenix FGX-Web Protect dashboard. At the top, there's a navigation bar with links: MY DASHBOARD, LATEST EVENTS, ANALYTICS, MANAGEMENT, and SUPPORT. Below this is a progress bar with steps: Intro, Step 1, Step 2, Step 3, and Done! The 'Intro' step is currently active. The main content area displays a welcome message: 'Welcome to FGX-Web Protect. Let's secure your site!'. It explains that the next step is to get the Security Seal onto the website to start monitoring. It also mentions that the 'Security Seal' is a small piece of code that allows analysis and alerting systems to monitor the website for threats. A circular graphic on the right indicates a '5 min Setup' time. At the bottom right, there is an orange button labeled 'Get Started >'. The footer of the dashboard includes contact information for support@foregenix.com and a link to the FAQ.

Once you understand what the Secure Seal does – click 'Get Started.'

Step 1

Here you can choose what technology your website runs on. There are 5 options presented to you:

1. PHP - If you are using a Linux host you will find most sites run on PHP or are able to run PHP scripts, choose this one if you are unsure. You will need to upload the file to the root of your webserver and using your FTP client will be the best method.
2. ASP.net - If you are using windows as your host and have classic ASP.net enabled

you will need this TAG. You will need to upload the file to the root of your webserver and using your FTP client will be the best method.

3. ASP.net – If you are using windows as your host you will need this TAG. You will need to upload the file to the root of your webserver and using your FTP client will be the best method.
4. Magento1 - Magento is an ecommerce platform that can run on Windows or Linux hosts, this plug in will work on both. You will need to use the plug in manager on Magento to install this plug in. This plugin will work on Magento v1.X
5. Magento2 – The Magento2 seal is for clients who are running Magento v2.X

To download the correct version of the Seal just click on the technology that your site uses. If you are unsure please check with your hosting provider as they will know what platform your site is running on, or contact support@foregenix.com for assistance. This guide will talk you through the ASP.net installation.

ASP.net Tag

If you are using windows as your host you will need the ASP.net tag. You will need to upload the file to the root of your webserver and using your FTP client will be the best method. The first step in this installation would be to download the seal. In this case you would need to select and download the ASP.net seal.

Which one do I need?

If your website is hosted with any major ecommerce platform (Wordpress, Drupal, Joomla!, etc) PHP is for you.

If your website is hosted by any Microsoft-based platforms (e.g nopCommerce) use the ASP Classic or ASP.NET options.

If your website is hosted on a Magento platform use the Magento option

Still not Sure?

[Step 2 >](#)

Step 2

The next step is to upload this ASP.net seal to your websites web root, typically found at the public_html folder. This can be done in two ways:

1. Upload via your hosting site – depending on your hosting provider this is typically accessible by a control panel from within your hosting account.
2. Upload via FTP/SFTP connection – Some customers have FTP/SFTP access to their sites in order to upload files to their website, the ASP.net can be uploaded this way as well.

Step 3

Once the seal is in place on your websites root directory you will then need to head back to the FGX-Web portal in order to validate the seal. Simply click this button to validate the seal.

Step 3: Validate your seal

Simply click the button below and we will check if the Seal is validated.

Is your site not validating when it should be?

Contact our support team at support@foregenix.com

☐ I WILL INSTALL THE SITE SEAL LATER

WAF Setup >

If the seal has been installed in the correct place then the seal should validate. However if it doesn't validate please contact our support team at support@foregenix.com for assistance.
