

What is WebScan?

rdavis@foregenix.com - 2020-05-06 - Comments (0) - FGX Web Lite

WebScan is an automated scanning tool that analyses a website for security vulnerabilities.

It performs a passive scan of the publicly available information on the website. WebScan checks the website for Malware, Framework vulnerabilities and missing patches.

It also analyses the SSL certificate to ensure it is valid and using the latest security protocols. WebScan is not a full External Vulnerability scan and at no point tries to exploit vulnerabilities.
